Introduction:

So many new programmers struggle from stepping out of the tutorial comfort zone. When I first started to learn I had the same issue, being constantly stuck in the tutorial loop, afraid to step out and work on

something independently. This step is crucial in taking your learning to the next level. For that reason I decided to make a post on the best project ideas for new developers to try on their own.

Project Ideas:

Small:

1. Tribute Page — Create a simple HTML/CSS tribute page. Add some JavaScript and make the page interactive for a tougher challenge
2. Personal Portfolio — Create a simple HTML/CSS/JavaScript portfolio page which displays other projects you've worked on
3. Product Landing Page — Create a landing page for one of your favorite products or services

Medium:

1. Recipe App — Create a web app for storing and searching your favorite recipes. Add functionality like the ability to share, like and comment on recipes
2. Movie App — Create a web app which displays the latest movies and gives users the ability to review/rate those movies

3. Password Generator — Create an app which generates secure passwords. Add functionality which allows users to select the strength of the passwords that are generated

Large:

1. Chat Application — Create an app which users can log in and chat other users
2. News Aggregator — Create a web app which scans the web for news stories and presents them to the user in a clean UI
3. Native App IOS / Android — Turn one of the Medium or Large projects into a native IOS or Android smartphone app

Conclusion:

Building apps and software on your own is a very important part of the learning process. Use these ideas to kick start your creative process and get building!
